# **Body Composition Analysis**

Results Interpretation

Body weight is the sum of Body Fat Mass and Lean Body Mass, which is composed of Dry Lean Mass and Total Body Water.

### **Obesity Analysis**

BMI is an index used to determine obesity by using height and weight. PBF is the percentage of body fat compared to body weight.

### Segmental Lean Analysis

Evaluates whether the muscles are adequately developed in the body.

The top bar shows the comparison of muscle mass to ideal weight while the bottom bar shows that to the current weight.

### **ECW/TBW Analysis**

ECW/TBW, the ratio of Extracellular Water to Total Body Water, is an important indicator of body water balance.

### Visceral Fat Level

Visceral Fat Level is an indicator based on the estimated amount of fat surrounding internal organs in the abdomen. Maintain a Visceral Fat Level under 10 to stay healthy.
